Quiz 2

Some formulas you may need: $\bar{x} = \frac{\sum x}{n}$ $s = \sqrt{\frac{\sum (x - \bar{x})^2}{n-1}} = \sqrt{\frac{\sum x^2 - \frac{(\sum x)^2}{n}}{n-1}}$

1. (8 points) Here is some data: 16 8 8 4 5 16 5 8

Data in increasing order: 4, 5, 5, 8, 8, 8, 16, 16

For this data, find the

a) mean

$$\bar{x} = \frac{4+5+\dots+16}{8} = \frac{70}{8} = \boxed{8.75}$$

b) median

$$\tilde{x} = \frac{8+8}{2} = \frac{16}{2} = \boxed{8}$$

c) mode

$$= \boxed{8}$$

d) midrange

$$= \frac{\text{low} + \text{high}}{2} = \frac{4+16}{2} = \frac{20}{2} = \boxed{10}$$

e) range

$$= \text{high} - \text{low} = 16 - 4 = \boxed{12}$$

f) standard deviation

$$\sum x^2 = 4^2 + 5^2 + \dots + 16^2 = 770$$

$$\sum x = 4 + 5 + \dots + 16 = 70$$

$$s = \sqrt{\frac{\sum x^2 - \frac{(\sum x)^2}{n}}{n-1}} = \sqrt{\frac{770 - \frac{(70)^2}{8}}{8-1}} = \boxed{s = 4.74341649}$$

g) variance

$$s^2 = (4.74341649)^2 = \boxed{22.5}$$

2. (2 points) Here are two data sets.

Data Set 1: 5, 27, 89, 95, 148, 150

Data Set 2: 321, 325, 321, 323, 326, 327

Let s_1 be the standard deviation of data set 1 and let s_2 be the standard deviation of data set 2. Which one is larger, s_1 or s_2 ? Explain! (Do not calculate s_1 or s_2)

s_1 is larger than s_2

bec. data set 1 is more spread out than data set 2
