## Intro to Probability Day 5 (More Difficult Probability Problems / Counting Techniques)

#### Summary of Formulas

 $P(E) = \frac{|E|}{|S|}$ 

Classical Method: Use if all outcomes are equally likely and if you know |E| and |S|

# of times event occured
# of times experiment was performed P(E) =

Empirical Method: Use when trying to ESTIMATE a probability when you can't calculate it another way. Repeat the experiment many times and find the percentage of times the event E occured

$$P(A \cup B) = P(A) + P(B)$$

You can ONLY use this formula if the events A and **B** are **DISJOINT** 

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

Use this formula if the events A and B are NOT DISJOINT

$$P(A \cap B) = P(A) \cdot P(B)$$

You can ONLY use this formula if the events A and **B** are **INDEPENDENT** 

$$P(A \cap B) = P(A) \cdot P(B|A)$$

Use this formula if the events A and B are NOT INDEPENDENT

 $P(\overline{A}) = 1 - P(A)$  $P(at \ least \ one) = 1 - P(none)$ 

## More Complicated Probability Examples

## REPHRASE THE QUESTION using the words AND, OR, or NOT

# Ex 17 (book hw sec. 5.4 #27): Playing a CD on the Random Setting

Suppose that a compact disc (CD) you purchased has 13 tracks. After listening to the CD, you decide that you like 5 songs. With the random feature on your CD player, each of the 13 songs is played once in random order. Find the probability that among the first 2 songs played

- a) You like both of them
- b) You like neither of them
- c) You like exactly one of them

d) Redo (a)-(c) if a song can be replayed before all 13 songs are played (if, for example, track 2 can be played twice in a row)

#### <u>Ex 18:</u>

Suppose you draw 2 cards from a standard poker deck. Find the probability that the total of the 2 cards is 20 if

a) The cards are drawn without replacementb) The cards are drawn with replacement

#### <u>Ex 19:</u>

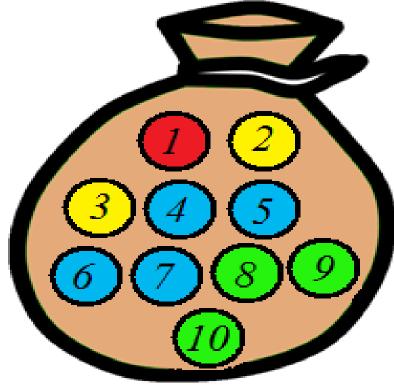

Suppose you draw 3 cards from a standard poker deck with replacement.

- a) What is the probability that none are aces?
- b) What is the probability that at least one are aces?
- c) What is the probability that all are aces?
- d) What is the probability that at least one is not an ace?
- e) Repeat parts (a)-(d) for the situation where that cards are drawn without replacement

<u>Ex 20:</u>

Experiment

- Draw 2 balls from the bag one by one without replacement
- Question:
- a) What is the probability that the
- 2<sup>nd</sup> ball drawn out of the bag is blue?

#### Ex 21 (book hw sec. 5.4 #33): The Birthday Problem

a) What is the probability that in a group of 30 people,everyone has a different birthday (ignoring leap years)b) What is the probability that in a group of 30 people, at least2 people have the same birthday (ignoring leap years)

## Section 5.5: Counting Techniques

### **Multiplication Rule for Counting**

Suppose an object can be built in 2 steps. If there are

*m* ways to complete step 1

and

*n* ways to complete step 2,

then

total number of objects is  $m \cdot n$ 

Note: This rule can be extended for objects that take 3 or more steps to build.

For examples 1-7, list a few outcomes of the experiment and count the total number of outcomes of the experiment

<u>Ex 1</u>:

Experiment

Flip a single coin four times

<u>Ex 2</u>:

Experiment

Flip a single coin once then roll a single die once

<u>Ex 3</u>:

Experiment

Roll a single die twice (or roll a pair of dice once)

<u>Ex 4</u>:

Experiment

Draw 3 cards from a deck one by one with replacement

<u>Ex 5</u>:

Experiment

Draw 3 cards from a deck one by one without replacement

<u>Ex 6</u>:

Experiment

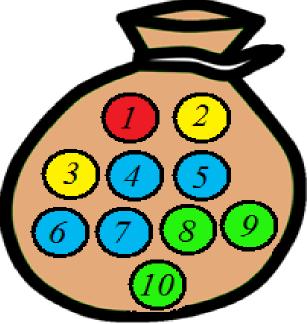

Draw 2 balls from the bag on the right

one by one with replacement

<u>Ex 7</u>:

Experiment

Draw 2 balls from the bag on the right one by one without replacement

- Ex 8: At Greg's sandwich shop you build sandwiches by choosing a bread, a deli meat, and a type of cheese. (you must choose one of each and ONLY one of each). Here are the available choices for each selection.
- Breads: White, Sourdough
- Deli Meats: Chicken, Turkey, Roast Beef
- Cheeses: American, Cheddar, Provolone, Swiss
- a) List a few sandwiches that can be made at Greg's shop.b) How many different sandwiches can be made at Greg's shop?
- c) How many different sandwiches can be made at Greg's shop that have chicken in them?
- d) If a sandwich is selected from Greg's shop at random, what is the probability that it has chicken in it?

Ex 9: License Plates

a) How many 7 character license plates can be made where the 2<sup>nd</sup>, 3<sup>rd</sup>, and 4<sup>th</sup> characters are letters and the rest are numbers?
b) How many 7 character license plates can be made where the 2<sup>nd</sup>, 3<sup>rd</sup>, and 4<sup>th</sup> characters are letters, the rest are numbers, and no repetition is allowed?

c) How many 7 character license plates can be made where the  $2^{nd}$ ,  $3^{rd}$ , and  $4^{th}$  characters are letters, the rest are numbers, and the letters can repeat but the numbers cannot?

d) What is the probability that a randomly selected 7 character license plate where the 2<sup>nd</sup>, 3<sup>rd</sup>, and 4<sup>th</sup> characters are letters and the rest are numbers has no repetition in its characters?
e) What is the probability that a randomly selected 7 character license plate where the 2<sup>nd</sup>, 3<sup>rd</sup>, and 4<sup>th</sup> characters are letters and the rest are numbers has no repetition in its numbers?

Ex (to motivate the factorial, permutation, & combination rules):

1) Three books (titled Algebra, Calculus, and Statistics) are to be put in a row on a shelf. How many different arrangements are possible?

2) You have a shelf that only has room for 3 books, but you have 5 books to choose from (titled Algebra, Calculus, Geometry, Trigonometry, and Statistics). How many ways are there to arrange 3 of these books in a row on the shelf?

3) Out of a group of 5 people (named Albert, Candice, George, Tom, and Sam) you are going to choose 3 people to be on a committee. How many different committees can be chosen?

### **The Factorial Rule**

The number of ways to arrange n objects in a row is n! (all objects are used, order matters, no repetition allowed)

## **The Permutation Rule**

The number of ways to select r objects out of n total and arrange them in a row is  ${}_{n}P_{r}$  (r objects are used out of n total, order matters, no repetition

allowed)

## **The Combination Rule**

The number of ways to select *r* objects out of *n* total and arrange them in a row is not counting order is  ${}_{n}C_{r}$ 

(*r* objects are used out of *n* total, order doesn't matters, no repetition allowed)

Counting Examples (Mixed)

Ex 9: How many 5 card poker hands are there?

<u>Ex 10</u>: Out of a group of 9 people, 5 people are going to be selected and lined up in a row to take a picture. How many different pictured are possible?

<u>Ex 11</u>: All people in a class of 9 people are going to line up in a row to take a picture. How many pictures are possible?

#### More Counting Examples (Mixed)

<u>Ex 12</u>: There are 12 horses in a horse race. A trifecta is a bet where you have to pick the horse who will come in 1<sup>st</sup>, 2<sup>nd</sup>, and 3<sup>rd</sup> in the correct order otherwise you lose. How many trifecta bets are possible? If each trifecta bet has the same chance of being a winning bet and you bet 18 trifecta bets, what is the probability that you will win one of your bets?

<u>Ex 13</u>: Out of a group of 10 people (the population), 5 people are going to be selected for a sample. How many different samples can be drawn?

<u>Ex 14</u>: In a 6-horse horse race, how many different outcomes of the race are possible (assuming you care about which place each horse came in)
